

# WEBSITE PROJECT WP (FREE DOCS)

## What is Website Project WP :

**Website Project WP** is a compatible script from PHP version  $\geq 7.2$ , to stop receiving bugs every week or month, a ready-to-use showcase site for an individual or a professional including without framework and without CMS just the required by library code used completely open source.

## The ideas:

The more website grew over the years, the energy consumption on the hardware and computer software would have to be increased for a simple showcase site whether under wordpress, joomla, wix and etc ... necessarily need a database and added additional plugins for natural referencing in SEO, SERP, SEM, the “frontend + backend = full stack” site design and especially each time you to login.

## Why:

Most web development frameworks or CMS you use (4 points):

1. **1 out of 2** unused variable functionalities maintained by a third party of a different person's team which leaves and joins in a septic organization to a technological one
2. **1 out of 2** features are not used at all
3. **1 out of 2** mandatories use the command line - (skill level = medium)
4. **1 out of 2** consumes more processor resource

## What is the solution:

The solution is to no longer refer to being dependent on a database, this solution including required ready-to-use and multi-lingual functionalities.

## for technical SEO has been implemented:

1. For social networks
2. For search engine

### Simplify, there's more to do:

1. Add or edit pages
2. To change information on "configuration / private.php" for particular
3. To change information on "configuration / business.php" for your company
4. To continue configured go there in the folder « configuration/\* .php »
5. The multi-language part is in the folder « language/**fr|en**/\* .php »
6. To put your copywriting writing in SEO
7. And don't forget to configure your ".htaccess" file if you are using apache

You can now download from <https://github.com/alexonbstudio/website-project> , configure et tested.

You want free web hosting to test your future website without a domain name, take a look at [Planethoster](#).

- the affiliation link: <https://www.planethoster.com/goph-af81b6dedd8f43f>
- Sponsorship code: [PHA-alexonbstudio](#)

### Techno used by default:

- PHP
- Json (=Json-LD)
- SVG/PNG
- Apache
- Text
- HTML
- XML

### The functionality seen by internet users/visitors and robots:

1. Analytics Google/Yandex/Quantcast/Meta-tags/Sitemap/Social networks/33Across
2. Chatbot crisp/tidio
3. Contact form
4. Page legal mandatory
5. Verify number phone & soon captcha with recaptcha/hcaptcha
6. Marketing & ads awin/uiz/goole adsense/google tag manager
7. Share Button shareaholic/addthis

### The time spent working (2 months and 4 days):

1. « 69 hours » + « .... »
2. Request for customisation

To build a viable structure and for simple management. For all modification requests additional pages: in webmaster or in web development, the price of this project maintained by **Alexon Balangue** of a payment in one time fees is from number of hours realized by **Alexon Balangue** and in addition to the additional charges to number of honoraria devoted for the work already carried out successfully on your future personality website.

# POOL DEVELOPER WEB

The development method is in Json as PHP >= 7.2, very easy to understand and without data base without risk of being hacked its SQL, because there is no SQL.

So :

- Configure the variables if necessary <Votre-Site.TLD>/\*
- On folder « configuration » variable in Json PHP array
- Then add Json\_decode() in one of the files <Votre-Site.TLD>/\* .php
- You can add functionality on <Votre-Site.TLD>/libs/custom/\* .php

Multi-language part:

- For « French » language/fr/\* .php Json PHP array
- For « English (US/GB) » language/en/\* .php en Json PHP array
- Then add Json\_decode() in one of the files <Votre-Site.TLD>/\* .php

Install libs (command line) with git & composer:

1. Git clone <https://github.com/alexonbstudio/website-project.git>
2. Cd /go/to/path/
3. Composer install or composer update
4. Composer autoload -o -a
5. Composer cc & then exit

Configure SEO that automatically generate an xml sitemap in <Votre-Site.TLD>/\*

Before launching (configure):

1. The files <Votre-Site.TLD>/themes/automate/\*
2. Access with your web browser <Votre-Site.TLD>/automate/generator/sitemap-index
3. Access with your web browser <Votre-Site.TLD>/automate/generator/sitemap-en
4. 4. Access with your web browser <Votre-Site.TLD>/automate/generator/sitemap-fr
5. your <Votre-Site.TLD>/sitemap-index.xml is ready !
6. your <Votre-Site.TLD>/sitemap-en.xml is ready !
7. your <Votre-Site.TLD>/sitemap-fr.xml is ready !

For CSP security, receive by email:

- The « uri-report » of the link is <Votre-Site.TLD>/security/csp-violate

Internal Json debugging of your website:

- <Votre-Site.TLD>/api/sites.json « info sites »
- <Votre-Site.TLD>/api/social.json « social network »
- <Votre-Site.TLD>/api/private.json « site owner info or company manager name »
- <Votre-Site.TLD>/api/business.json « company info »
- <Votre-Site.TLD>/api/images.json « manager tape images »
